

DESKPAWS WEBSITE — HANDOFF PACKAGE

v2.1 · 2026-07-10 · Routing + live status board · hero rejected at first review
→ correction cycle active

The package now describes **shipped reality**, not plans. Claude Code builds against these documents as-is.

The documents & routing

File	Send to	Status
01_CREATIVE_DIRECTION.md v2.0	Everyone	✅ current — Scene 04 annotations remapped to shipped objects; surface ritual web-owned; fold coda text-only at launch
02_3D_MODEL_SPEC.md v2.0 FINAL	reference (authored by the 3D chat)	✅ describes the delivered GLBs — the ground truth
02b_3D_ASSET_HANDOFF.md	Claude Code	✅ loader/tier contract from the 3D chat
03_HIGGSFIELD_ASSET_BRIEF.md v2.0	Higgsfield chat	🟡 one asset open (HF-V06a) — status board inside
04_COPY_DECK.md v2.0	Claude Code (+ Higgsfield for context)	✅ current — verbatim source for all site copy
05_WEBSITE_BUILD_SPEC.md v2.1	Claude Code (Fable 5)	✅ current — §3.5 Rendering Environment Contract added
06_HERO_CORRECTION_DIRECTIVE.md	Claude Code — read	🔴 active — ordered fix list for the rejected hero, with acceptance

	FIRST next session	gates
--	-----------------------------------	-------

Claude Code session setup: put 01 , 02 , 02b , 04 , 05 , 06 in a /docs folder in the repo plus both GLBs in /public/models/. Tell it: *“Read 06 first, then /docs in numeric order. 05 is your contract; 02/02b win any conflict about assets. Execute the 06 correction list, submit the hero side-by-side, then stop for review.”*

What changed in v2.0 (the 3D pivot, summarized)

- **Two-tier GLB system** (desktop 363k tris / mobile 75k), meshopt + WebP, **Draco retired**. One file fetched per session via the detect-gpu logic in 02b.
- **Owner node names are the binding contract** (`Basket Top` , `Basket Bottom` , `Base Structure.001` , `Screw.001` , `Plane desktop-only` , `Desk`).
- **No baked animation clips yet** → all motion is code-driven sequences in the build (Build Spec §4), with a clip-adaptor so baked clips can replace them later invisibly.
- **Clamp + frame are one merged object** → 3D fold animation blocked (coda ships as copy only); exploded view redesigned around the four real objects — and honestly reads better (“one piece” = the stability story).
- **Desk surface ritual moved from 3D pipeline to the web build** (runtime PBR texture swap with a Phase-3 quality gate and a graceful walnut-only fallback).

Open items (the complete list — nothing else is pending)

1.  **HF-V06a “Elevation”** — the last Higgsfield asset (choreography spec in 03 §3.0).
2.  **Split** `Base Structure.001` into clamp + frame (3D chat; pipeline supports it) → unblocks `fold` + frame-separated explode, both slotted behind flags in the build.
3.  **Six baked animation clips** (3D chat, after the split) — optional quality upgrade; the site launches on code-driven motion.
4.  **Static Cut stills** — 4 keyframe renders each for Scenes 03/04/09 from the 3D chat (reduced-motion/no-WebGL fallback); grey placeholders until then.
5.  **Desk PBR texture sets** — sourced by the build itself (CC0), decided at the Phase-3 quality gate.
6.  **Plush color QC — CONFIRMED ON SCREEN** at the first hero review (the

“camouflage” fur). The build runs the fur decision tree (05 §3.5.6); if it lands on level c/d, the 3D chat retints the desktop `Basket Top` bake to match `fur_gray`.

7.  Real customer reviews to replace the placeholder cards; wash-temperature verification from the supplier; the “vertical installation” claim (test on the sample before adding to copy); PP Neue Montreal license (fallback named in 05).

The three sentences that keep everyone aligned

1. The product is the main character: it stays on screen and travels through the story — sections change around it.
2. Every animation must explain the product, advance the story, or prove quality — otherwise it gets cut.
3. Geometry explains, film seduces: 3D for mechanics and trust, Higgsfield footage for fur, cats, and the evening exhale — joined by match cuts.
